

Southampton High School Storm Water Pollution Prevention Plan

Client: Southampton Union Free School District
Project Location: Southampton, NY

GPI was responsible for the preparation of a Storm Water Pollution Prevention Plan associated with the reconstruction of the Southampton High School track and athletic field area. GPI prepared the analysis and documents required to comply with New York State Pollution Discharge Elimination (SPDES) General Permit No. GP-02-01 for Construction Activities associated with improvements to this High School track and field site. This involved the review of the construction design plans, the existing topography of the area surrounding the project site and assessing the impact of run-off from the proposed project. A silt and erosion control plan was then prepared for the site to prevent and or minimize the potential negative impacts of the project construction activities on downstream facilities and surface water bodies.
